LIB2024 Internet Applications

Final Exam/Assignment Innovation Report

There are many ways the teaching learned in this course effect the Library and Information Services industry today. While in person, libraries use computer applications to do most of the heavy lifting in circulation, but in reference, there is a lot more browser supported applications. Most library catalogues can be found online, academic databases are also found online filled with reports, articles, and journals. Each online resource makes use of HTML, CSS and JS in some way or another.

The development of browser applications is not very common in the library workplace, however, creating interactive library websites are. In a development setting, Github is used to connect workers with each other's code, able to update on the fly and work more closely together. In a global pandemic, this is a priority, so in-person interactions can be reduced. Github enables all of this to happen, as well provide a reliable location documenting the history of the code and track changes.

The applications that were less coding based, that of Pexels, Photopea and the various font locations are useful when creating advertisements for events. Graphics for events take time, and the listed applications can be used to create successful and pleasant looking event posters or banners. Proper advertising of events can be just as important as the work for the circulation or cataloguing services. Foot traffic through the door with unique and fun events is essential to creating a thriving library. All because of the tools to make the advertisements.
